Draw a plan view sketch of the basement and first floor of the building. Indicate air sampling locations, possible indoor air pollution sources and PID meter readings. If the building does not have a basement, please note.

ó

#### Basement:

# 12, OUTDOOR PLOT

Draw a sketch of the area surrounding the building being sampled. If applicable, provide information on spill locations, potential air contamination sources (industries, gas stations, repair shops, landfills, etc.), outdoor air sampling location(s) and PID meter readings.

Also indicate compass direction, wind direction and speed during sampling, the locations of the well and septic system, if applicable, and a qualifying statement to help locate the site on a topographic map.

^{*} Describe the condition of the product containers as Unopened (UO), Used (U), or Deteriorated (D)

^{**} Photographs of the front and back of product containers can replace the handwritten list of chemical ingredients. However, the photographs must be of good quality and ingredient labels must be legible.

MACTEC Engineering and Consulting, Inc. 107 Audubon Road, Bldg. 2, Suite 30! Wakefield, MA 01880

## H, FLOOR PLANS

Draw a plan view sketch of the basement and first floor of the building. Indicate air sampling locations, possible indoor air pollution sources and PID meter readings. If the building does not have a basement, please note.

## Basement:

## 12. OUTDOOR PLOT

Draw a sketch of the area surrounding the building being sampled. If applicable, provide information on spill locations, potential air contamination sources (industries, gas stations, repair shops, landfills, etc.), outdoor air sampling location(s) and PID meter readings.

Also indicate compass direction, wind direction and speed during sampling, the locations of the well and septic system, if applicable, and a qualifying statement to help locate the site on a topographic map.

## 11. FLOOR PLANS

Draw a plan view sketch of the basement and first floor of the building. Indicate air sampling locations, possible indoor air pollution sources and PID meter readings. If the building does not have a basement, please note.

## Basement:

20 - Shezab IA: Indoor Jr

#### 12. OUTDOOR PLOT

Draw a sketch of the area surrounding the building being sampled. If applicable, provide information on spill locations, potential air contamination sources (industries, gas stations, repair shops, landfills, etc.), outdoor air sampling location(s) and PID meter readings.

Also indicate compass direction, wind direction and speed during sampling, the locations of the well and septic system, if applicable, and a qualifying statement to help locate the site on a topographic map.

## 11. FLOOR PLANS

Draw a plan view sketch of the basement and first floor of the building. Indicate air sampling locations, possible indoor air pollution sources and PID meter readings. If the building does not have a basement, please note.

#### Basement:

#### First Floor:

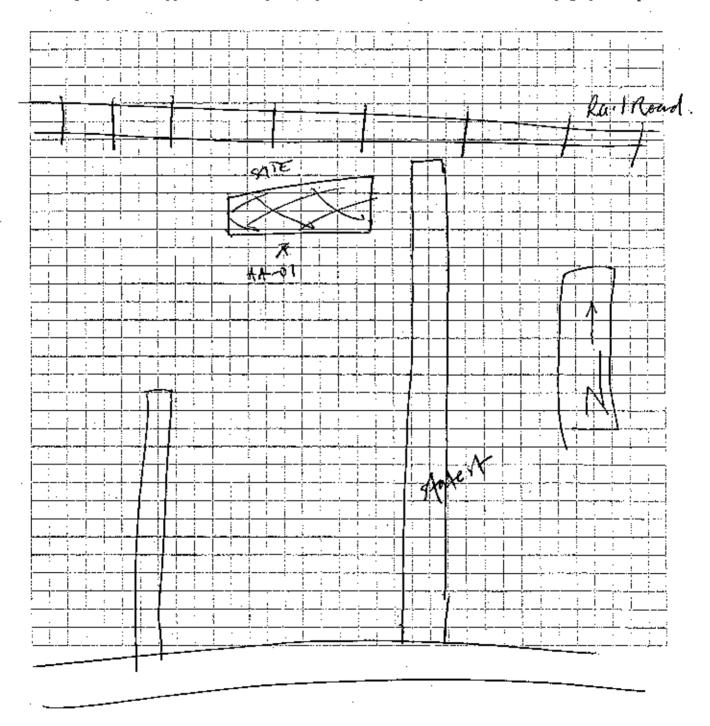

# NMA. Site C

#### 12. OUTDOOR PLOT

Draw a sketch of the area surrounding the building being sampled. If applicable, provide information on spill locations, potential air contamination sources (industries, gas stations, repair shops, landfills, etc.), outdoor air sampling location(s) and PID meter readings.

Also indicate compass direction, wind direction and speed during sampling, the locations of the well and septic system, if applicable, and a qualifying statement to help locate the site on a topographic map.

NOIA -CITEC

Make & Model of field instrument used: pro MM Kal - DING

List specific products found in the residence that have the potential to affect indoor air quality.

## 11, FLOOR PLANS

Draw a plan view sketch of the basement and first floor of the building. Indicate air sampling locations, possible indoor air pollution sources and PID meter readings. If the building does not have a basement, please note.

Basement: howe

## First Floor:

#### 12. OUTDOOR PLOT

Draw a sketch of the area surrounding the building being sampled. If applicable, provide information on spill locations, potential air contamination sources (industries, gas stations, repair shops, landfills, etc.), outdoor air sampling location(s) and PID meter readings.

Also indicate compass direction, wind direction and speed during sampling, the locations of the well and septic system, if applicable, and a qualifying statement to help locate the site on a topographic map.

^{*} Describe the condition of the product containers as Unopened (UO), Used (U), or Deteriorated (D)

^{**} Photographs of the front and back of product containers can replace the handwritten list of chemical ingredients. However, the photographs must be of good quality and ingredient labels must be legible.

## 11. PLOOR PLANS

Draw a plan view sketch of the basement and first floor of the building. Indicate air sampling locations, possible indoor air pollution sources and PID meter readings. If the building does not have a basement, please note.

Basement: No lasent

## First Floor:

# K

#### 12, OUTDOOR PLOT

Draw a sketch of the area surrounding the building being sampled. If applicable, provide information on spill locations, potential air contamination sources (industries, gas stations, repair shops, landfills, etc.), outdoor air sampling location(s) and PID meter readings.

Also indicate compass direction, wind direction and speed during sampling, the locations of the well and septic system, if applicable, and a qualifying statement to help locate the site on a topographic map.

^{*} Describe the condition of the product containers as Unopened (UO), Used (U), or Deteriorated (D)

^{**} Photographs of the front and back of product containers can replace the handwritten list of chemical ingredients. However, the photographs must be of good quality and ingredient labels must be legible.

#### 11. FLOOR PLANS

Draw a plan view sketch of the basement and first floor of the building. Indicate air sampling locations, possible indoor air pollution sources and PID meter readings. If the building does not have a basement, please note.

Basement: Note

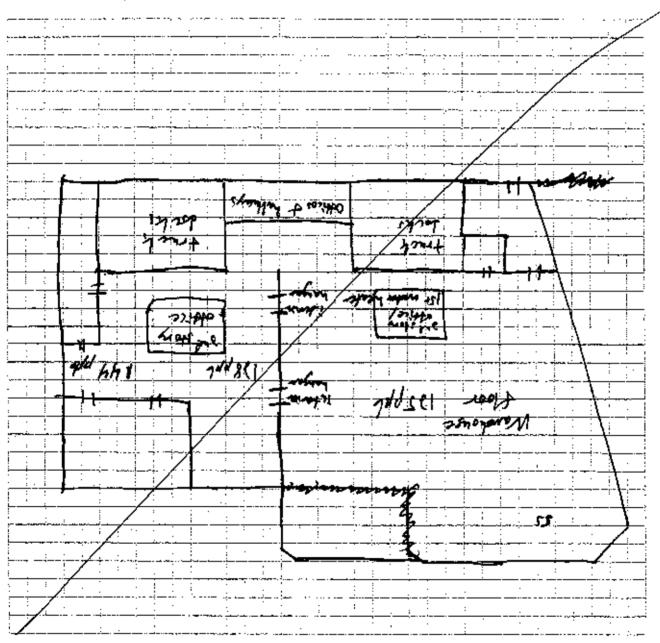

#### 12. OUTDOOR PLOT

Draw a sketch of the area surrounding the building being sampled. If applicable, provide information on spill locations, potential air contamination sources (industries, gas stations, repair shops, landfills, etc.), outdoor air sampling location(s) and PID meter readings.

Also indicate compass direction, wind direction and speed during sampling, the locations of the well and septic system, if applicable, and a qualifying statement to help locate the site on a topographic map.

again, see estached; it's difficult to key truck of layer layout

^{*} Describe the condition of the product containers as Unopened (UO), Used (U), or Deteriorated (D)

^{**} Photographs of the front and back of product containers can replace the handwritten list of chemical ingredients. However, the photographs must be of good quality and ingredient labels must be legible.

#### 12. OUTDOOR PLOT

Draw a sketch of the area surrounding the building being sampled. If applicable, provide information on spill locations, potential air contamination sources (industries, gas stations, repair shops, landfills, etc.), outdoor air sampling location(s) and PID meter readings.

Also indicate compass direction, wind direction and speed during sampling, the locations of the well and septic system, if applicable, and a qualifying statement to help locate the site on a topographic map.

Are there air distribution ducts present?

Describe the supply and cold air return ductwork, and its condition where visible, including whether there is a cold air return and the tightness of duct joints. Indicate the locations on the floor plan diagram.

#### 11. FLOOR PLANS

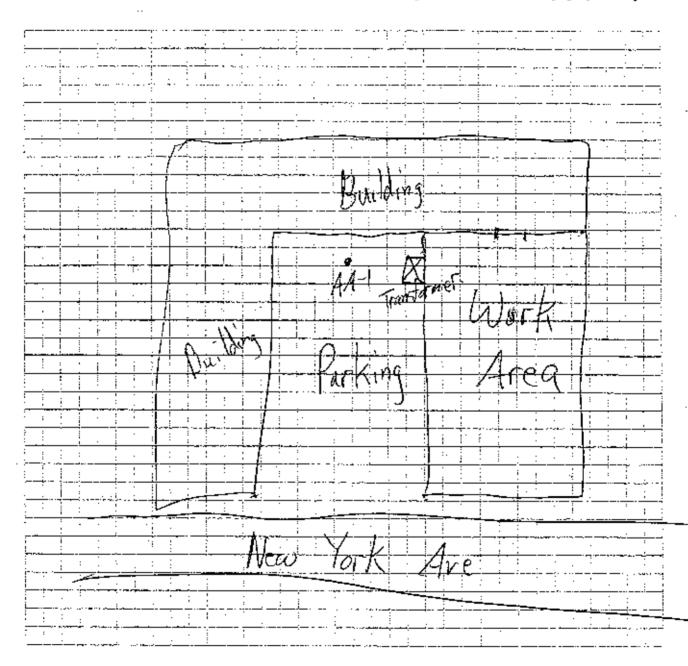

Draw a plan view sketch of the basement and first floor of the building. Indicate air sampling locations, possible indoor air pollution sources and PID meter readings. If the building does not have a basement, please note.

No Basenert. Basement: Concrete Slahs Sout First Floor: (400 ppb) PID Readings 100 Stairs Fork lift Door way

#### 12. OUTDOOR PLOT

Draw a sketch of the area surrounding the building being sampled. If applicable, provide information on spill locations, potential air contamination sources (industries, gas stations, repair shops, landfills, etc.), outdoor air sampling location(s) and PID meter readings.

Also indicate compass direction, wind direction and speed during sampling, the locations of the well and septic system, if applicable, and a qualifying statement to help locate the site on a topographic map.

### DATA USABILITY SUMMARY REPORTS AND ANALYTICAL DATA

### DATA USABILITY SUMMARY REPORT FEBRUARY 2010 AIR SAMPLING NEW CASSEL INDUSTRIAL AREA WESTBURY, NEW YORK

### 1.0 INTRODUCTION

Thirty-four air samples were collected at the New Cassel Industrial Area in Westbury, New York in February 2010 and submitted for off-site laboratory analysis. Samples were analyzed by Centek Laboratories located in Syracuse, New York. Results were reported in the following Sample Delivery Groups (SDGs): C1002059 and C1002060.

A listing of samples included in this Data Usability Summary Report is presented in Table 1. A summary of the analytical results is presented in Table 2. Samples were analyzed by the following method:

• Volatile organic compounds (VOCs) by USEPA Method TO-15

Deliverables for the off-site laboratory analyses included a Category B deliverable as defined in the New York State Department of Environmental Conservation (NYSDEC) Analytical Services Protocols (NYSDEC, 2005).

A project chemist review was completed based on NYSDEC Division of Environmental Remediation guidance for Data Usability Summary Reports (NYSDEC, 2002). Laboratory QC limits were used during the data evaluation unless noted otherwise. The project chemist review included evaluations of sample collection, data package completeness, holding times, QC data (blanks, instrument calibrations, duplicates, surrogate recovery, and spike recovery), data transcription, electronic data reporting, calculations, and data qualification. The following laboratory or data validation qualifiers are used in the final data presentation.

U = target analyte is not detected at the reported detection limit

J = concentration is estimated

UJ = target analyte is not detected at the reported detection limit and is estimated

EJ = concentration is above the calibration range and is estimated

Results are interpreted to be usable as reported by the laboratory unless discussed in the following sections.

### 2.0 VOLATILE ORGANIC COMPOUNDS (VOCS)

VOC - Initial and Continuing Calibration

#### SDG C1002059

For the continuing calibration (analyzed February 28, 2010) associated with a subset of samples, the percent difference between the initial calibration average relative response factor (RRF) and the continuing calibration RRF was greater than 30 for benzyl chloride (-46). Benzyl chloride

was not detected in the associated samples, and quantitation limits were qualified as estimated (UJ) in samples 130043B-IA-01, 130043B-IA-02, and 130043A-SS-01.

### SDG C1002060

For the continuing calibration (analyzed March 1, 2010) associated with all samples, the percent difference between the initial calibration average relative response factor (RRF) and the continuing calibration RRF was greater than 30 for benzyl chloride (-59). Benzyl chloride was not detected in the associated samples, and quantitation limits were qualified as estimated (UJ) in all samples of SDG C1002060.

### **VOC - Surrogates**

### **SDG C1002059**

Percent recovery for the surrogate bromofluorobenzene (136) in sample 130043F-IA-02 was above the control limits of 70-130 percent, indicating a potential high bias. Positive detections of all target compounds reported in sample 130043F-IA-02 were qualified as estimated (J) and may represent potential high biases.

### **VOC - Internal Standards**

### SDG C1002059

One or more internal standard areas were outside control limits in the initial undiluted analyses and/or subsequent diluted analyses of the following samples:

| 130043A-IA-01 | 130043F-IA-02  |
|---------------|----------------|
| 130043A-IA-02 | 130043V-IA-01  |
| 130043B-IA-01 | 130043V-22-02D |
| 130043B-IA-02 | 130043V-IA-02  |
| 130043F-IA-01 | 130043A-SS-01  |

Positive and non-detected results associated with these internal standards were qualified as estimated (J/UJ).

#### SDG C1002060

One or more internal standard areas were outside control limits in the initial undiluted analyses and/or subsequent diluted analyses of the following samples:

| 130043B-SS-02 | 130043K-SS-03 |
|---------------|---------------|
| 130043B-SS-03 | 130043N-SS-01 |
| 130043F-SS-02 | 130043N-SS-02 |
| 130043K-SS-01 | 130043V-SS-02 |

Positive and non-detected results associated with these internal standards were qualified as estimated (J/UJ).

### VOC – Laboratory Control Samples

#### SDG C1002 059

Percent recoveries for bromodichloromethane (133) and carbon tetrachloride (142) were above the LCS control limits of 70-130 percent in the LCS (analyzed February 27, 2010). Positive detections of bromodichloromethane and carbon tetrachloride in associated samples were qualified as estimated (J).

Percent recoveries for 1,3,5-trimethylbenzene (65) and tetrachloroethene (201) were outside the control limits in the LCS (analyzed February 28, 2010). In addition, the relative percent difference (RPD) between LCS and LCS duplicate recoveries for tetrachloroethene (49) was above the control limit of 30. Positive and non-detected results for 1,3,5-trimethylbenzene and tetrachloroethene were qualified as estimated (J/UJ) in associated samples.

### SDG C1002060

Percent recovery for tetrachloroethene (201) was above the control limits in the LCS (analyzed February 28, 2010) associated with sample 130043F-SS-02. In addition, the relative percent difference (RPD) between LCS and LCS duplicate recoveries for tetrachloroethene (49) was above the control limit of 30. The positive detection of tetrachloroethene in associated sample 130043F-SS-02 was qualified as estimated (J).

Percent recoveries of 1,2,4-trimethylbenzene (65), 1,3,5-trimethylbenzene (68), 2-propanol (60), methyl tert-butyl ether (46), tetrahydrofuran (62), and vinyl acetate (63) were below the control limits in the LCS (analyzed March 1, 2010). Positive and non-detected results for these analytes were qualified as estimated (J/UJ) in associated samples.

### VOC – Field Duplicates

A single field duplicate was collected from soil vapor location 130043V-SS-02. As discussed below, relatively large differences were observed between the original sample and the field duplicate indicating that low precision of measurement may have been obtained for the soil vapor samples. A detailed review of laboratory data and field collection records identified no sample identification or data reporting errors. The canister pressure for both samples had gone to <1 "Hg at the end of sample collection. This may have impacted the results reported from these canisters. Based on professional judgment, only results for the original sample 130043V-SS-02 and the associated field duplicate were qualified. However, the data user should consider all soil vapor results as potentially estimated due to uncertainties regarding sampling and/or analytical precision.

### SDG C1002059 and C1002060

Relative percent differences (RPDs) between field duplicate results for sample 130043V-SS-02 (SDG C1002060) and field duplicate 130043V-SS-02D (SDG C1002059) were above the limit of 100 for a subset of target analytes. Duplicate pair results that are above the RPD limit and validation qualification actions are summarized below:

| Analyte               | Sample Conc<br>(ug/m3) | Field Dup Conc<br>(ug/m3) | RPD | Qualifler |
|-----------------------|------------------------|---------------------------|-----|-----------|
| 1,1,1-Trichforoethane | 290                    | 3800                      | 172 | J         |
| 1,1-Dichloroethanc    | 8.2                    | 79                        | 162 | .1        |
| 1,1-Dichloroethene    | 25                     | 780                       | 138 | J         |
| 1,4-Dioxane           | ND                     | 27                        | 184 | 1/01      |
| 2-Propanol            | ND                     | 21                        | 193 | J/UJ      |
| 4-Methyl-2-pentanone  | 31                     | 1000                      | 188 | j J       |
| Heptane               | 9.7                    | 3.I                       | 103 | J         |
| Trichloroethene       | 5.8                    | 43                        | 153 | J         |
| o-Xylene              | 80                     | 360                       | 127 | J         |

ND = Non-detected

### VOC - Sample Quantitation

### SDG C1002059 and C1002060

The laboratory qualified a subset of results with "E" to indicate the reported concentrations were above the calibration range. During data validation, 'E' qualifiers were changed to 'EJ' qualifiers. to indicate the results are above the calibration range and are considered estimated.

### VOC - Sample Reporting

Two laboratory control sample summaries were missing from the data package originally submitted to MACTEC. The laboratory was contacted and the missing LCS summaries were received on April 21, 2010.

El = Estimated; concentration is above the linear range of ealthratic

Units: up/th2 = Micrograms per cubic meter

### DATA USABILITY SUMMARY REPORT MAY 2010 SOIL SAMPLING NEW CASSEL INDUSTRIAL AREA WESTBURY, NEW YORK

### 1.0 INTRODUCTION

Four soil samples were collected at the New Cassel Industrial Area in Westbury, New York in May 2010 and submitted for off-site laboratory analysis. Samples were analyzed by CHEMTECH located in Mountainside, New Jersey. Results were reported in the following Sample Delivery Group (SDG): B2399.

A listing of samples included in this Data Usability Summary Report is presented in Table 1. A summary of the analytical results is presented in Table 2. Samples were analyzed by the following method:

• Volatile organic compounds (VOCs) by USEPA Method 8260B

Deliverables for the off-site laboratory analyses included a Category B deliverable as defined in the New York State Department of Environmental Conservation (NYSDEC) Analytical Services Protocols (NYSDEC, 2005).

A project chemist review was completed based on NYSDEC Division of Environmental Remediation guidance for Data Usability Summary Reports (NYSDEC, 2002). Laboratory QC limits were used during the data evaluation unless noted otherwise. The project chemist review included evaluations of sample collection, data package completeness, holding times, QC data (blanks, instrument calibrations, duplicates, surrogate recovery, and spike recovery), data transcription, electronic data reporting, calculations, and data qualification. The following laboratory or data validation qualifiers are used in the final data presentation.

U =target analyte is not detected at the reported detection limit J =concentration is estimated

UJ = target analyte is not detected at the reported detection limit and is estimated

Results are interpreted to be usable as reported by the laboratory unless discussed in the following sections.

### 2.0 VOLATILE ORGANIC COMPOUNDS (VOCS)

### **VOC** - Initial Calibration

The initial calibration exceeded the percent relative standard deviation limit of 20 for the compound chloroethane (25). Chloroethane was not detected in any of the associated samples, and the reporting limits were qualified as estimated (UJ).

### **VOC-** Tentatively Identified Compounds

Naphthalene was identified as a tentatively identified compound (TIC) in sample 130043V-DP511 and was qualified as 'NJ'.

### DATA USABILITY SUMMARY REPORT FEBRUARY 2011 AIR SAMPLING NEW CASSEL INDUSTRIAL AREA NEW CASSEL, NEW YORK

### 1.0 INTRODUCTION

Four sub-slab samples and four air samples were collected at the New Cassel Industrial Area in New Cassel, New York in February 2011 and submitted for off-site laboratory analysis. Samples were analyzed by Centek Laboratories located in Syracuse, New York. Results were reported in Sample Delivery Group (SDG) C1102015.

A listing of samples included in this Data Usability Summary Report is presented in Table 1. A summary of the analytical results is presented in Table 2. A summary of data validation actions is presented in Table 3. Samples were analyzed by the following method:

Volatile organic compounds (VOCs) by USEPA Method TO-15

Deliverables for the off-site laboratory analyses included a Category B deliverable as defined in the New York State Department of Environmental Conservation (NYSDEC) Analytical Services Protocols (NYSDEC, 2005).

A project chemist review was completed based on NYSDEC Division of Environmental Remediation guidance for Data Usability Summary Reports (NYSDEC, 2010). USEPA Region 2 QC limits were used during the data evaluation unless noted otherwise. The project chemist review included evaluations of sample collection, data package completeness, holding times, QC data (blanks, instrument calibrations, duplicates, surrogate recovery, and spike recovery), data transcription, electronic data reporting, calculations, and data qualification. The following laboratory or data validation qualifiers are used in the final data presentation.

U = target analyte is not detected at the reported detection limit
 J = concentration is estimated
 UJ = target analyte is not detected at the reported detection limit and is estimated

Results are interpreted to be usable as reported by the laboratory unless discussed in the following sections.

### 2.0 VOLATILE ORGANIC COMPOUNDS (VOCS)

### VOC - Internal Standards

One or more internal standard areas were outside control limits in the diluted analyses of the following samples:

| 130043C-SS-01     |
|-------------------|
| 130043C-SS-01 DUP |

Positive detections of tetrachioroethene in both samples and 1,1,1-trichloroethane in 130043C-SS-01 were qualified as estimated (J).

### VOC - Laboratory Control Samples

Percent recoveries of 1,4-dioxane (15, 41) were below control limits in the LCS and LCS/LCSD associated with all sample analyses. These LCS analyses were associated with all initial undiluted analyses of the samples. The relative percent difference (RPD) between LCS and LCSD recoveries for 1,4-dioxane (75) was also outside the control limit. Positive and non-detected results for 1,4-dioxane in all samples in SDG C1102015 were qualified as estimated (J/UJ) as summarized in Table 3 and may represent potential low biases.

All samples in SDG C1102015 were qualified as summarized in Table 3 based on LCS/LSCD percent recoveries and/or RPDs that were outside control limits for the following target analytes:

| Analyte                 | %Rec | RPD |
|-------------------------|------|-----|
| 2-Hexanone              | 66   |     |
| 4-Methyl-2-pentanone    | 42   | 64  |
| Methyl tert-butyl ether | İ    | 40  |
| Tetrahydrofuran         | i    | 32  |

Positive and non-detect results were qualified as estimated (J/UJ) in all samples as summarized in Table 3.
